

MULTI-THREADED SERVER ACCEPT SYSTEM AND METHODABSTRACT OF THE DISCLOSURE

5           A multi-threaded server accept system and method creates a socket accept  
thread by a control thread of a server process, receives a service request from a client  
by the socket accept thread, and transfers the request to a data structure. The system  
and method further comprise retrieving the request by the control thread from the data  
structure, transferring the request to a client thread, by the control thread, to process  
10 request data associated with the request, and processing the request data by the client  
thread.
